TOPIC 1 | Workflow Execution Evidence

Production Workflow Planning & Design Patterns

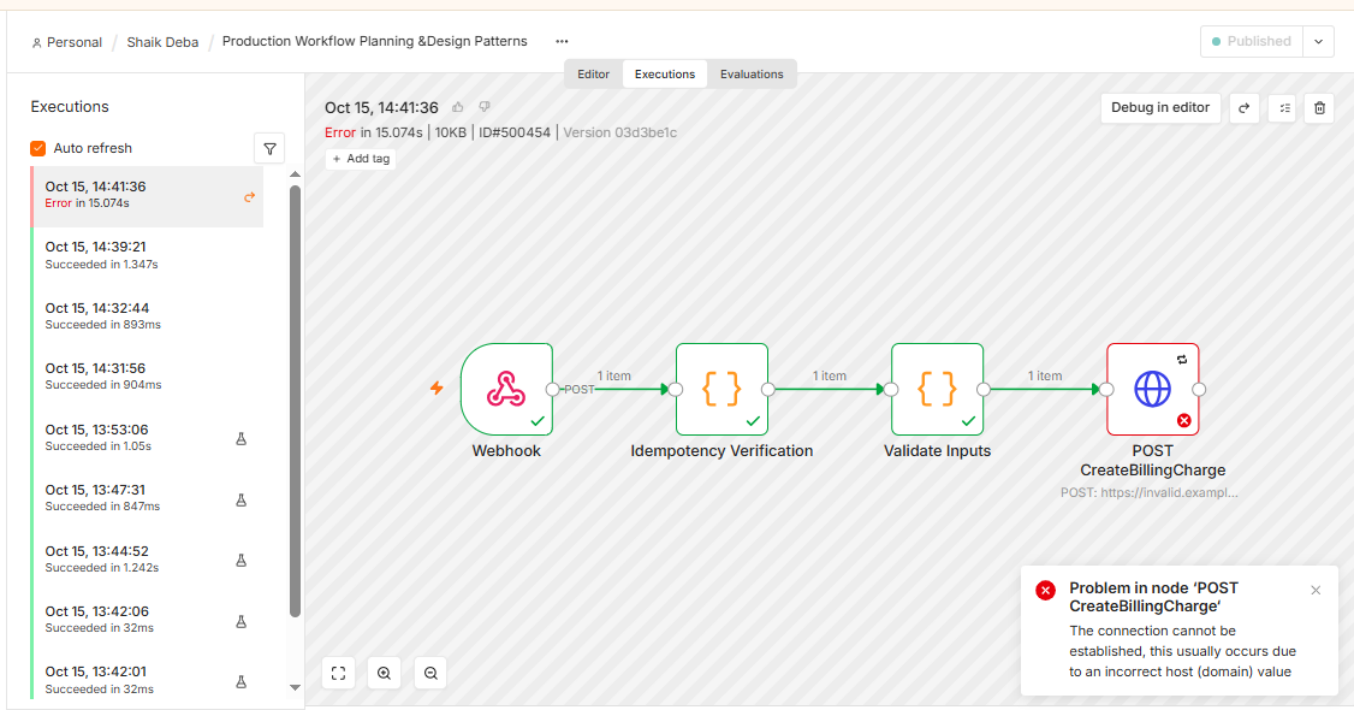

Evidence date: 15 October 2026 | Platform: n8n | Test type: Intentional failure and centralized alerting

Outcome: The main workflow failed as intended, the linked Error Handler executed successfully, and an error notification was received by email. This demonstrates the centralized failure notification path, not all production-readiness requirements.

Verification	Observed result
Main workflow execution	500454 | Error | 15.074 seconds
Error handler execution	500455 | Succeeded | 3.019 seconds
Email alert	Received with failure context and execution ID

Evidence 1 — Main workflow failure

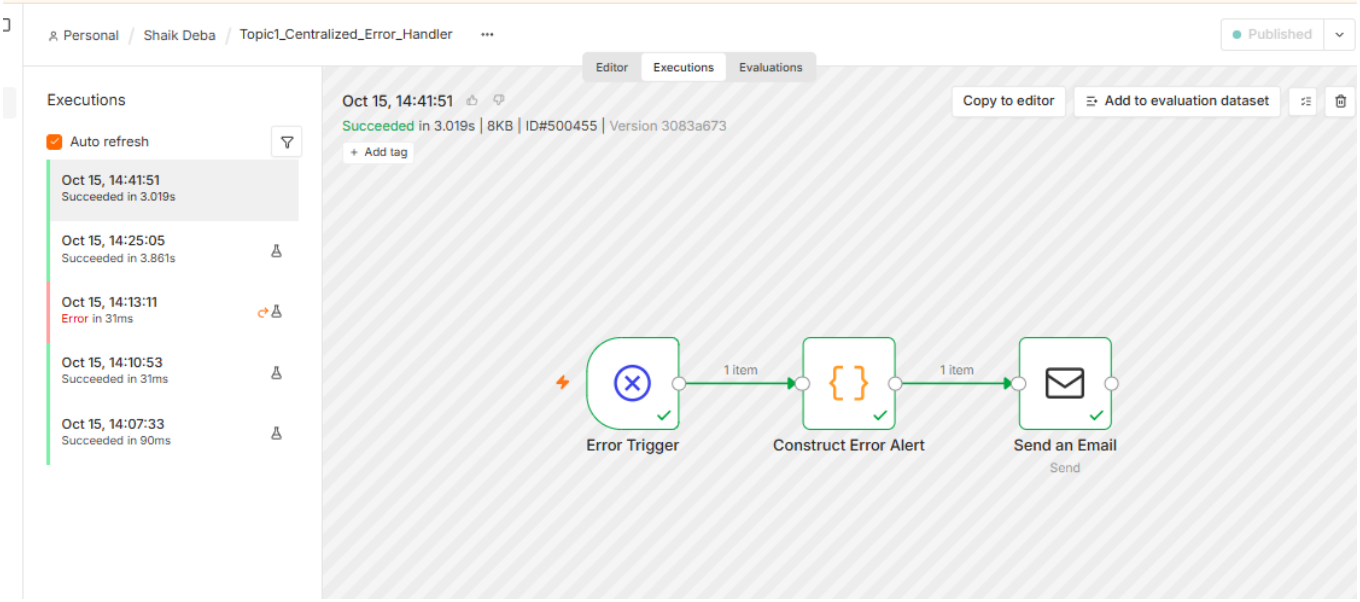

The production webhook, transaction ID verification and input validation nodes completed. The POST CreateBillingCharge HTTP Request failed intentionally against an invalid hostname. Main execution 500454 is marked Error.

Evidence status: VERIFIED from supplied screenshot.

Evidence 2 — Centralized Error Handler

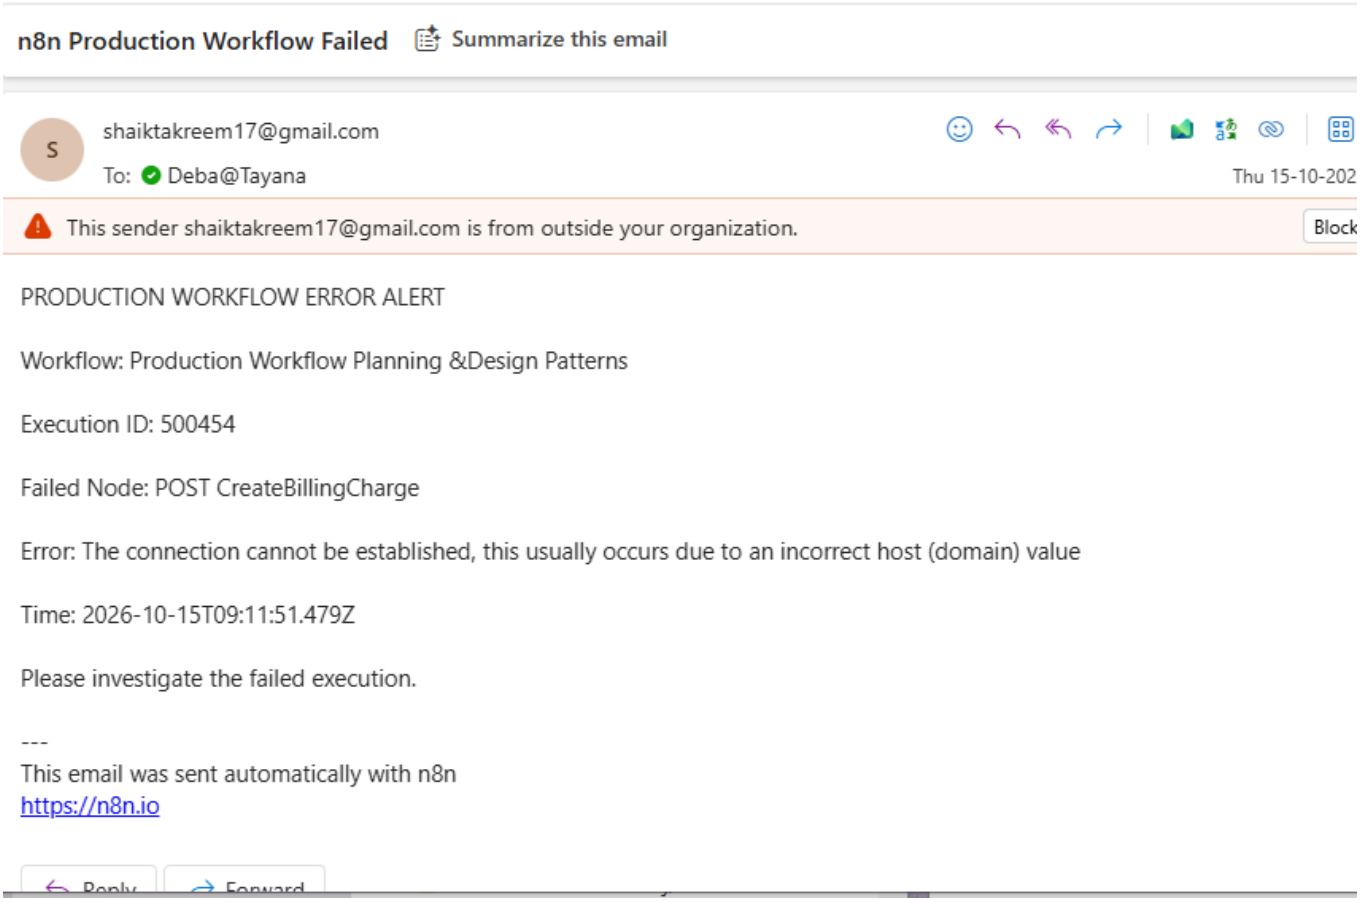

A separate published Error Handler started after the main failure. Error Trigger, Construct Error Alert and Send an Email all completed successfully. Handler execution 500455 is marked Succeeded.

Evidence status: VERIFIED from supplied screenshot.

Evidence 3 — Received email notification

The received email identifies the failed production workflow, execution ID 500454, failed HTTP node, connection/hostname error and timestamp. This confirms delivery of the operational notification.

n8n Production Workflow Failed Summarize this email

PRODUCTION WORKFLOW ERROR ALERT

Workflow: Production Workflow Planning &Design Patterns

Execution ID: 500454

Failed Node: POST CreateBillingCharge

Error: The connection cannot be established, this usually occurs due to an incorrect host (domain) value

Time: 2026-10-15T09:11:51.479Z

Please investigate the failed execution.

This email was sent automatically with n8n

Reply Forward

Evidence status: VERIFIED from supplied screenshot.

Assessment Notes & Outstanding Items

• Verified: A failed automatic main-workflow execution invoked the separate error handler and sent an email.

• Configured: Four total HTTP attempts with a fixed 5000 ms interval; exact individual attempts are not shown in these screenshots.

• Not yet evidenced: Persistent Redis/database duplicate prevention, exponential backoff, real billing API credentials, Slack alerts, and infrastructure persistence settings.

• After test: Restore the HTTP endpoint to https://httpbin.org/post and publish the corrected workflow.
