Topic 2 - Workflow Execution Evidence

Multi-Modal Data Transformation & PDF Extraction | n8n hands-on intermediate assessment

Evidence captured: 15 October 2026 | Result: successful training execution

1. Objective and scope

Demonstrate a multi-modal pipeline that extracts structured information from a simulated PDF invoice, cleans two legacy JSON orders, merges the three records, maps them to a common ERP-ready format, posts them to a mock HTTP endpoint, and generates an audit summary.

2. Execution result

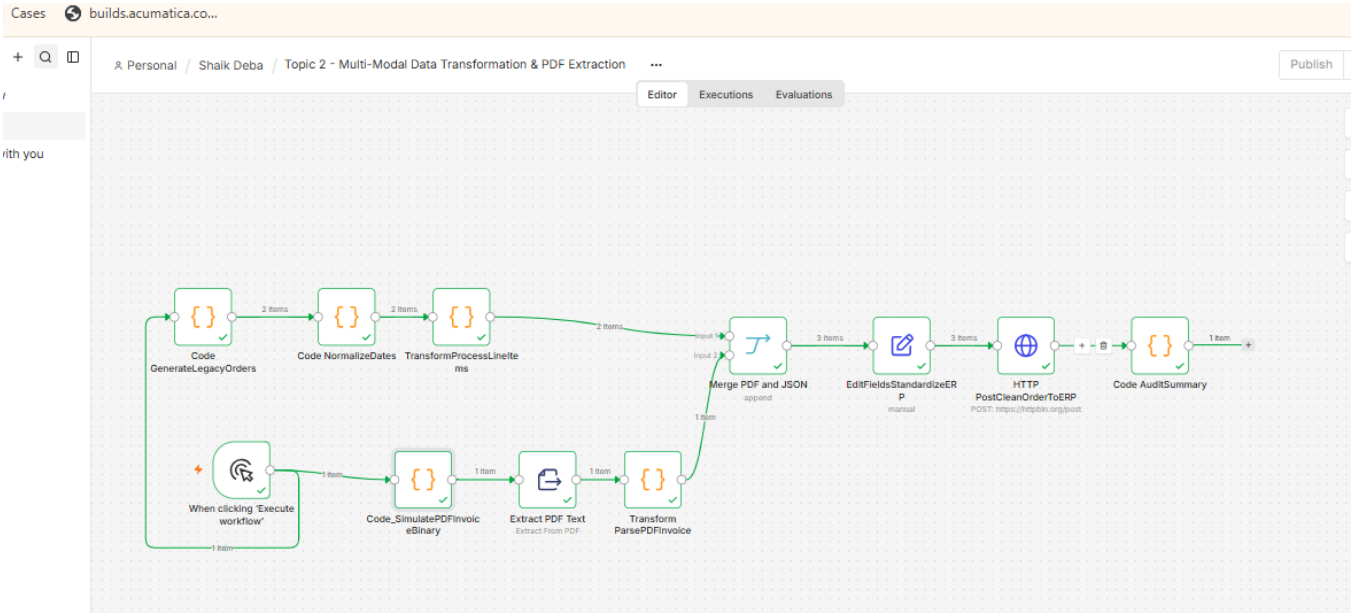

Evidence field	Observed value
Workflow result	All displayed nodes show green success indicators
Legacy JSON records	2
PDF invoice records	1
Merge output	3 items
HTTP POST output	3 items
Audit status	COMPLETED
Total orders	3
Total amount	1565.46

3. Order-level reconciliation

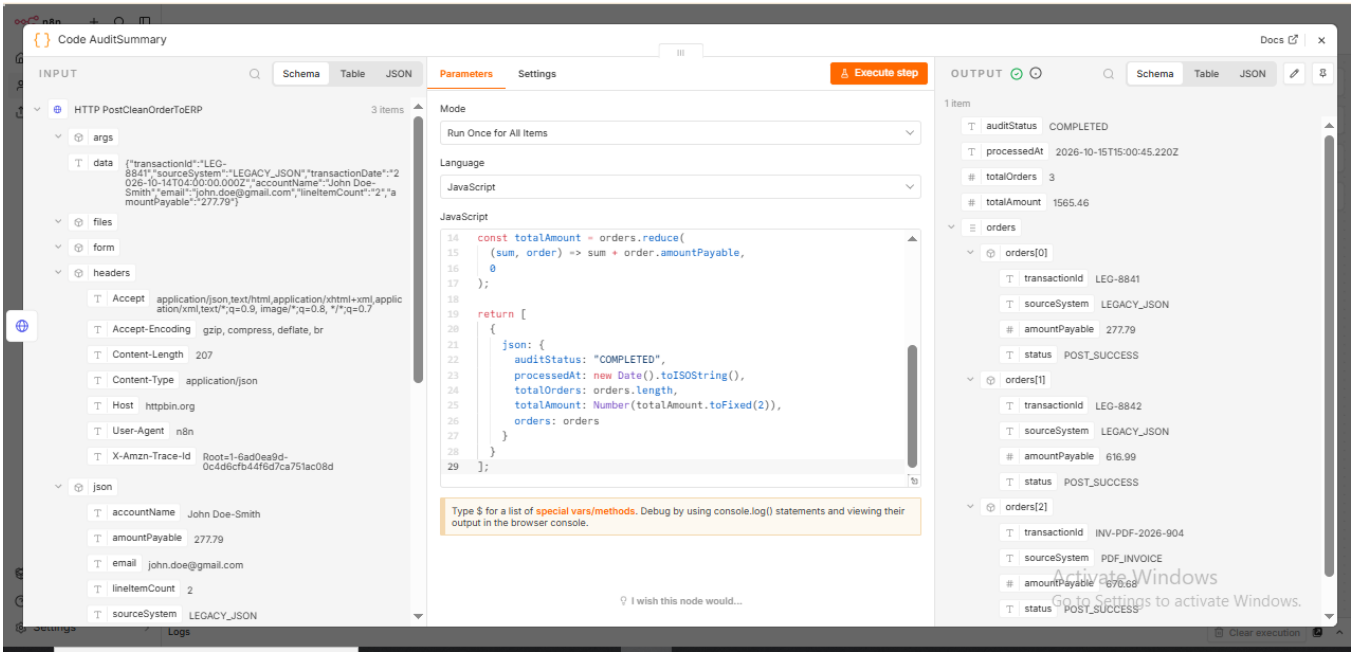

Transaction ID	Source	Amount	Status
LEG-8841	LEGACY_JSON	277.79	POST_SUCCESS
LEG-8842	LEGACY_JSON	616.99	POST_SUCCESS
INV-PDF-2026-904	PDF_INVOICE	670.68	POST_SUCCESS
TOTAL		1565.46	3 records

Check: 277.79 + 616.99 + 670.68 = 1565.46.

4. Screenshot evidence

Evidence A. Complete n8n canvas: both branches, merge, standardization, HTTP POST, and audit node show green checks.

Evidence B. Code AuditSummary output: COMPLETED, 3 orders, total amount 1565.46, with individual order statuses.

5. Verification and limitations

- Successful execution is evidenced by the supplied screenshots; this report does not claim an independent rerun of the n8n workflow.

- The target https://httpbin.org/post is a public HTTP echo endpoint, not an actual ERP system. The status POST_SUCCESS represents the test workflow result, not confirmed ERP persistence.

- Sample PDF and legacy JSON inputs are simulated. Before production use, add real ERP credentials, schema validation, retry/error routing, duplicate prevention, and monitoring.
